

Work Log

Daily Work Report Tracker

A daily task & attendance logger with automated weekly reporting

Offline edition · Cloud edition (hosted, multi-user)

Prepared by	Manish Kumar Sabbani — Technical Support Analyst
Organisation	TechSquad LLC
Version	3.4 (glass theme, newest-first log, admin editing & settings)
Date	15 September 2026
Status	Complete, hosted & in daily use
Live at	https://manishsabbani2606.github.io/Task-Tracker/
Deliverable	Offline: task-tracker-2.0.html · Cloud (hosted): worklog-cloud.html

1 Executive Summary

The Daily Work Report Tracker (“Work Log”) is a lightweight web application that lets me log my daily support tasks and working hours, and export a formatted weekly report for management review.

It was built to replace ad-hoc note-taking with a consistent, structured record of daily activity. Each day I clock in and out, log the tasks I worked on — with ticket numbers, category, SLA priority, status, and the **end user** I helped — and the tool keeps a running tally of hours and task time. At the end of each week, a single click produces a professional PDF report summarising attendance and every task, branded for TechSquad LLC.

Version 3.0 added a cloud edition (**worklog-cloud.html**): the same tool, hosted online for free, with real sign-in and data saved to a central database so every user's timesheet is kept safely and is available from any device — with an admin view of the whole team (see §9). Version 3.3 added a per-task **end-user** field and made the cloud sign-in opt-in (see §6).

Version 3.4 is an interface and workflow release focused on the cloud edition: a polished **glass (frosted) theme**, the daily log now shows the **newest task first**, the administrator can **edit any logged task**, a dedicated **Settings page** with a personal “**Hello, <name>**” **greeting**, and a refreshed, more professional typeface (Plus Jakarta Sans). See §6 and §10.

What it does	Daily task logging, clock in/out attendance, weekly PDF reporting
Who it is for	Any individual tracking day-to-day work for weekly updates — the owner and any external users the file is shared with
Accounts	Each user creates a profile (name, company, role, password) and signs in; profiles are kept separate
End user	Each task records the end user assisted, so the weekly report shows who each piece of work was for
Personalisation	A Settings page greets each user by name and lets them switch theme; the admin can correct any logged task
Privacy	Offline edition keeps everything on-device; the cloud edition stores data in a dedicated Firebase project

2 Purpose & Objectives

The project set out to deliver a simple, reliable tool that satisfies a recurring need: submitting an accurate weekly activity report to management.

- **Capture work consistently** — record each task with enough structure (ticket, category, SLA priority, status, end user, time) to be meaningful in a report.
- **Track attendance** — log clock-in and clock-out times and automatically calculate hours worked.
- **Automate weekly reporting** — turn a week of daily entries into a polished, presentation-ready PDF in one click.
- **Be effortless to use daily** — fast entry, the most recent task on top, and a one-click correction path for the admin.
- **Look the part** — a professional, modern interface (glass theme, refined typography) that reads as a real internal tool.

3 Key Features

Feature	Description
User accounts	Sign-up / sign-in with name, company, role and password; each user has a private profile.
Daily task log	Record each task with a description, optional ticket number, category, SLA priority, end user and time spent (minutes).
End user field	Each task records the end user — the person assisted — shown in the report's User column. The report header still names the analyst as author.
Newest task first new 3.4	The daily log lists the most recently added task at the top , so the latest work is seen first without scrolling.
Admin task editing new 3.4	The administrator can edit any field of a logged task (description, end user, ticket, category, SLA priority, status, time) from an Edit dialog. Restricted to the admin account; regular users cannot edit past entries.
Settings page new 3.4	A dedicated Settings panel opened from the top bar — shows the signed-in account, an Administrator badge where applicable, and appearance controls, with a Sign out button.
Personal greeting new 3.4	A “Hello, <name> 🙌” welcome — on the dashboard and at the top of Settings — naming whoever is signed in.
Glass theme new 3.4	An optional frosted, translucent look with a soft gradient backdrop; works in both light and dark and is toggled from Settings.
SLA Priority	Low, Medium, High, Urgent — colour-coded for quick scanning.
Status	Each task is Open, In Progress or Resolved, updated as work progresses.
Clock in / out	One-click clock-in and clock-out; attendance hours are calculated automatically.
KPI dashboard	Live cards for hours today, task time today, open tasks, and total hours this week.
Weekly PDF report	One-click export of a branded report: attendance summary plus a Task Log table (Date, Task, User, Category, SLA Priority, Status, Time).
Opt-in login	Keep me signed in checkbox on the cloud sign-in screen; when unticked the session ends as soon as the browser or tab is closed (§6).
Dark mode	Light/dark theme toggle that remembers the chosen preference.
Cloud sync cloud edition	Hosted online with real accounts; data saved centrally and available on any device, in real time.
Admin overview cloud edition	The admin can view and export every user's timesheet from one place.

4 User Guide — Daily Workflow

The intended daily routine takes under a minute of overhead:

1. **Open & sign in.** Open the tracker, then sign in (or create an account on first use). A “Hello, <name>” greeting confirms who is signed in.
2. **Clock in.** On arrival, click *In* under Clock in (or type the time). Click *Out* when leaving.
3. **Log tasks through the day.** Type the work, add a ticket number, pick a category and SLA priority, enter the **end user** and the minutes, then click *Add task*. The newest task appears at the top of the list.
4. **Update status.** Switch a task between Open, In Progress and Resolved as work moves along. The admin can also open *Edit* on a task to correct any detail.
5. **Submit the day.** Click *Submit* to lock the day's attendance once finished.

The day navigator (◀ Today ▶) moves between dates, so a missed entry can be back-filled at any time. All totals — attendance hours, task time, and the KPI cards — update automatically.

5 The Weekly Report

The exported PDF is designed to be handed directly to management. It contains a branded header (with the analyst's name and role), summary cards, an Attendance Summary table, and a Task Log table with Date, Task, User, Category, SLA Priority, Status and Time columns; long descriptions wrap and the table carries its header across page breaks, with page numbering throughout.

SAMPLE PROVIDED

A sample weekly report PDF (**Weekly_Report_sample.pdf**) is included alongside this document to illustrate the exact output format.

6 Accounts, Settings & Editing

Version 2.1 added a sign-in layer so the tracker can be shared with multiple people — each keeps a private profile and sees only their own timesheets. Creating an account captures the user's name, company, job title, email and a password; these details personalise the app and appear on that user's exported report.

Session persistence & “Keep me signed in”

The cloud sign-in is **opt-in**: by default a session lasts only as long as the browser is open. Ticking *Keep me signed in* uses Firebase `LOCAL` persistence to stay signed in across restarts on a trusted device; leaving it unticked uses `SESSION` persistence, which the browser discards when it closes.

Settings page & greeting new 3.4

A gear icon in the top bar (and a *Settings* button on the dashboard greeting) opens a **Settings** panel. It opens with a personal welcome — “**Hello, <first name>** 🙌” and “Signed in as <email>” — so it is always clear who is logged in. The panel has three parts:

- **Account** — the signed-in name, email, company and role, plus an *Administrator* badge for the admin account.
- **Appearance** — switches for the *Glass theme* and *Dark mode* (see §10). Choices are remembered per browser.
- **Sign out** — ends the session from within the panel.

The same “Hello, <name>” greeting also appears as a banner at the top of the dashboard immediately after signing in.

Newest task first new 3.4

The daily task list is ordered so the **most recently added task is at the top**. Nothing about how tasks are stored changes — only the on-screen order — so totals, the weekly preview and the exported report are unaffected.

Editing a logged task — administrator only new 3.4

Previously a task could be added, have its status changed, or be deleted, but its wording and details could not be corrected without deleting and re-adding it. Version 3.4 adds a full **Edit** action:

- An **Edit (pencil) button** appears on each task row **only for the administrator**, and only on the admin's own log — never for regular users, and never while the admin is viewing another user's timesheet (which stays read-only).
- Editing opens a dialog pre-filled with the task's **description, end user, ticket, category, SLA priority, status and time**. Saving writes the change straight back to Cloud Firestore and refreshes the list.

WHY ADMIN-ONLY

Restricting edits to the administrator keeps a clean audit trail for regular users — their entries can be corrected centrally but not quietly rewritten — while giving the owner full control over their own record. The restriction is enforced in the interface; each user's own data remains writable by them (add / delete / status) as before.

7 Technical Overview

Architecture	Single self-contained HTML file (markup, styles and logic in one document)
Languages	HTML, CSS, and vanilla JavaScript — no frameworks
Typeface	Plus Jakarta Sans (Google Fonts) with a system-font fallback stack new 3.4
Theme system	Light / dark via a <code>data-theme</code> attribute; the glass look layers over either via a <code>data-glass</code> attribute — both remembered in <code>localStorage</code>
PDF generation	jsPDF (client-side); the report is produced entirely in the browser
Charts & icons	Inline SVG — no image assets or external libraries
Accounts / passwords	Offline: local profiles, hashed with SHA-256 via the Web Crypto API. Cloud: Firebase Authentication.
Session persistence	Cloud: Firebase <code>setPersistence</code> (LOCAL vs SESSION), chosen by “Keep me signed in”.
Data storage	Offline: browser <code>localStorage</code> per account. Cloud: Cloud Firestore, per-user, with live listeners.
Admin editing	Gated in the UI by the signed-in email; writes go through the same per-user Firestore path, so the security rules are unchanged
Browser support	Any modern browser (Chrome, Edge, Safari, Firefox), desktop and mobile

A NOTE ON THE GLASS EFFECT

The frosted surfaces use the CSS `backdrop-filter` property. All modern browsers support it; on any browser that does not, surfaces simply render as solid cards and the app remains fully usable.

8 Data Persistence & Backup

Reliable persistence was a core requirement: work logged today must be present tomorrow. The cloud edition saves every change to Cloud Firestore automatically and syncs it live across devices. The offline edition handles this on-device at three levels: automatic in-browser save (with a visible “✓ Saved” confirmation), a backup & restore `.json` file, and optional auto-save straight to a file on Chrome and Edge. An *Export my data (JSON)* button is available in both editions.

RECOMMENDED SETUP

For a personal, on-device log, open the offline edition in Chrome or Edge and enable auto-save into a OneDrive folder. For team use with central storage, cross-device access and an admin overview, use the cloud edition (§9).

9 Cloud Edition (Hosted & Multi-User)

The cloud edition (**worklog-cloud.html**) turns Work Log into a hosted, multi-user application. It keeps the identical interface, but replaces on-device storage with a real backend.

Authentication	Firebase Authentication (email & password) — real, server-side sign-in; passwords handled by Google, never seen by the app
Database	Google Cloud Firestore — each user's profile and daily logs stored in the cloud
Privacy model	Security rules enforce that every user reads and writes only their own data, while the designated admin can read all users' timesheets
Admin overview	A “team timesheets” panel to open and export any user's weekly report (read-only). Editing applies only to the admin's own log (§6).
Real-time sync	Live Firestore listeners — data updates instantly across devices and in the admin view (no refresh)
Access control	Invite-only: only email addresses the admin adds to the invite list can create an account, enforced by the security rules
Hosting	Static site on GitHub Pages (free), live at https://manishsabbani2606.github.io/Task-Tracker/
Cost	Free — a small team sits comfortably within the Firebase and GitHub Pages free tiers

10 Design & User Experience

Version 2.0 introduced a professional, enterprise-grade interface. Version 3.4 refines it further with a new typeface, an optional glass theme, and small workflow touches.

- **Colour palette** new 3.4 — a professional **graphite-and-amber** scheme: graphite chrome (logo, avatar, report header) with a warm amber accent for primary actions, replacing the earlier indigo. Applied across the app and the exported PDF.
- **Typography** new 3.4 — the interface now uses **Plus Jakarta Sans**, a modern, geometric sans-serif chosen for a polished, professional feel, with a system-font fallback so text always renders.
- **Glass theme** new 3.4 — an optional frosted look: translucent, blurred surfaces over a warm amber-and-sky gradient backdrop, with subtle highlights. It layers on top of either light or dark mode and is toggled from Settings (on by default, remembered per browser).
- **Newest-first log** new 3.4 — the day's most recent task sits at the top of the list.
- **Settings & greeting** new 3.4 — a dedicated panel and a personal “Hello, <name>” welcome (§6).
- **Application shell** — a sticky top bar with the Work Log mark, the user's name and role, and quick access to Settings, theme and sign-out.
- **KPI dashboard & chart** — four summary cards and a weekly-hours bar chart.
- **Responsive & accessible** — tables scroll within their own frame on narrow screens; focus rings, reduced-motion support and a fully designed dark mode throughout.

11 Version History

Version	Date	Summary of changes
1.0	Baseline	Core tracker: daily task log, clock in/out with hour calculation, weekly PDF export, and automatic local storage.
1.5–1.8	2 Sep 2026	Ticket / priority / status fields, expanded categories, dark mode, TechSquad branding; persistence hardening with backup & restore and optional auto-save to a file.
2.0	3 Sep 2026	Professional redesign: application top bar, KPI dashboard, weekly-hours chart, SVG iconography and a refined colour system.
2.1	3 Sep 2026	User accounts & login: per-user local profiles, private data per profile, personalised reports and sign out.
3.0–3.1	4 Sep 2026	Cloud edition (Firebase Auth + Firestore), admin view, cross-device sign-in and GitHub Pages hosting; daily tasks and the PDF shown as tables; “Priority” renamed SLA Priority; mobile responsive fix.
3.2	4 Sep 2026	Cloud edition went live on GitHub Pages; real-time sync (live listeners); invite-only sign-ups with an admin-managed invite list; Forgot-password option.
3.3	11 Sep 2026	Per-task end-user field (shown in the report's User column); opt-in login persistence — a “Keep me signed in” checkbox, session otherwise ending when the browser closes.
3.4	15 Sep 2026	Interface release: new graphite-and-amber colour palette (replacing indigo), across the app and the exported PDF; glass (frosted) theme toggle; daily log shows the newest task first; administrator can edit any logged task; a dedicated Settings page with a personal “Hello, <name>” greeting; new professional typeface (Plus Jakarta Sans). Cloud edition.

12 Limitations & Future Enhancements

Area	Note / opportunity
Admin editing scope	The admin edits their own log; viewing another user's timesheet stays read-only by design. Editing others' entries, or an edit history/audit log, could be added if needed.
Glass on older browsers	Browsers without <code>backdrop-filter</code> fall back to solid surfaces — no loss of function, only the frosted effect.
Browser-bound storage (offline)	In the offline edition, in-browser data is tied to one browser on one computer; mitigated by the backup file and auto-save. The cloud edition removes this.
Possible additions	Monthly reporting, search/filter across history, per-category time analytics, and further theme options.

13 Deliverables

File	Description
worklog-cloud.html	Cloud edition — hosted, multi-user app with Firebase login and Firestore storage (v3.4).
firestore.rules	Cloud security rules (each user private; admin can read all) for the Firebase edition.
task-tracker-2.0.html	Offline edition — the complete single-file application (includes local login).
task-tracker.html	Working copy (kept in sync with the current version).
supabase-setup.sql	Alternative backend script (Supabase/Postgres) for the same hosted model.
Weekly_Report_sample.pdf	A sample of the exported weekly report (with the Task Log table).
This document	Project documentation (PDF).
